

Clinical Guidelines: Pain Management in Asthma Patients For patients with active asthma or a history of bronchospasm, the use of non-steroidal anti-inflammatory drugs (NSAIDs) such as Ibuprofen or Naproxen is contraindicated, as it can trigger a severe asthma attack.

Recommended alternative: For the management of mild to moderate pain in these patients, the first line of choice is Paracetamol in doses up to 3000mg daily. It is completely safe for the respiratory tract.
